INTRODUCTION

1.1 Introduction

Computers play an important role in our daily life. Anything we want we can get only with one mouse click. Speed, reliability and accuracy of the computer make it a powerful tool for different purposes. A very important and basic need of today's modern business world is the quick availability and processing of information using computers. One can easily get the type of required information within a fraction of a second. The project that I have taken is also in this category which is used in our daily life whenever we want to purchase some items we can easily get at our home.

E-commerce (electronic commerce) is the buying and selling of goods and services, or the transmitting of funds or data, over an electronic network, primarily the internet. These business transactions occur either as business-to-business (B2B), business-to-consumer (B2C), consumer- to-consumer or consumer-to-business. The terms e-commerce and e-business are often used interchangeably. The term e-tail is also sometimes used in reference to the transactional processes for online shopping.

1.2 Objective

Developing a GUI based automated system, which will cover all the information Related to all products which are used in our daily life. This site contains all the products related to **Marigold** So by this GUI based automated system a user wants to purchase something then it is only a mouse click away to purchase these products.

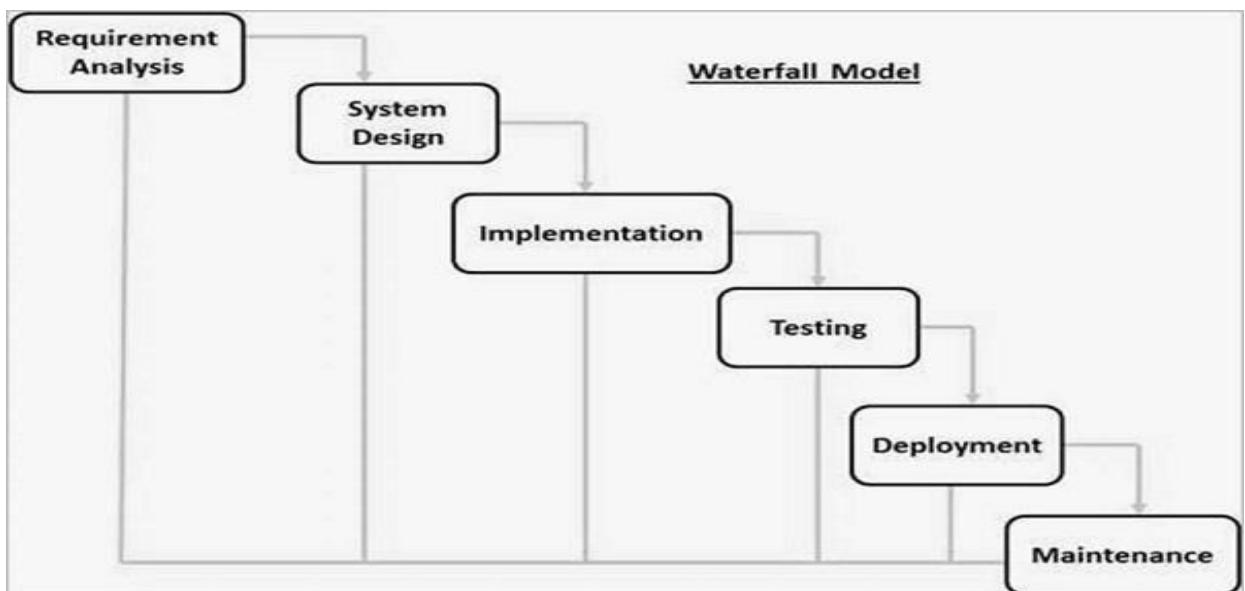

E-commerce is mainly useful for those who don't have time to go shopping or for the customers. Those who have just entered this website and bought what they want at any time can visit the web-site.

Customers will choose different items like mobile, laptops, etc. This website is based on this formula. After choosing items they pay the bill cart process. Customers will get their items just sitting at home.

1.3 Needs of Ecommerce

The “**Ecommerce**” is developed according to the current need in different Fields. This is an Ecommerce Website which provides a facility for purchasing marigold items. So by using this system users who want to purchase some products will first Register an account on this portal then Login through their Username and Password, and then Select items which they want to purchase and add them to cart and finally checkout by giving payment details. So by using this portal users can easily purchase products from their home.

1.4 Methodology Development Model

The sequential phases in Waterfall model are –

Requirement Gathering and analysis – All possible requirements of the system to be developed are captured in this phase and documented in a requirement specification document.

- **System Design** – The requirement specifications from the first phase are studied in this phase and the system design is prepared. This system design helps in specifying hardware and system requirements and helps in defining the overall system architecture.

- **Implementation** – With inputs from the system design, the system is first developed in small programs called units, which are integrated in the next phase. Each unit is developed and tested for its functionality, which is referred to as Unit Testing.
- **Integration and Testing** – All the units developed in the implementation phase are integrated into a system after testing of each unit. Post integration the entire system is tested for any faults and failures.
- **Deployment of system** – Once the functional and non-functional testing is done; the product is deployed in the customer environment or released into the market.
- **Maintenance** – There are some issues which come up in the client environment. To fix those issues, patches are released. Also to enhance the product some better versions are released. Maintenance is done to deliver these changes in the customer environment.

1.5 Tools and Technique

- a. Php
- b. HTML
- c. Java Script
- d. Css

Php

Hypertext Preprocessor (or simply **PHP**) is a server-side scripting language designed for Web development, but also used as a general-purpose programming language. It was originally created

by Rasmus Lerdorf in 1994,¹ the PHP reference implementation is now produced by The PHP Group. PHP

originally stood for Personal *Home Page*,¹ but it now stands for the recursive acronym *PHP: Hypertext Preprocessor*.

PHP code may be embedded into HTML code, or it can be used in combination with various web template systems, web content management systems, and web frameworks. PHP code is usually processed by a PHP interpreter implemented as a module in the web server or as a Common Gateway Interface (CGI) executable. The web server combines the results of the interpreted and executed PHP code, which may be any type of data, including images, with the generated web page. PHP code may also be executed with a command-line interface (CLI) and can be used to implement standalone graphical applications.

HTML

Hypertext Markup Language (HTML) is the standard markup language for creating web pages and web applications. With Cascading Style Sheets (CSS) and JavaScript, it forms a triad of cornerstone technologies for the World Wide Web.^[4]

Web browsers receive HTML documents from a web server or from local storage and render the documents into multimedia web pages. HTML describes the structure of a web page semantically and originally included cues for the appearance of the document.

HTML elements are the building blocks of HTML pages. With HTML constructs, images and other objects such as interactive forms may be embedded into the rendered page. HTML provides a means

create structured documents by denoting structural semantics for text such as headings, paragraphs, lists, links, quotes and other items.

Java Script

JavaScript, often abbreviated as JS, is a high-level, interpreted programming language. It is a language which is also characterised as dynamic, weakly typed, prototype-based and multi-paradigm.

Alongside HTML and CSS, JavaScript is one of the three core technologies of the World Wide Web. JavaScript enables interactive web pages and thus is an essential part of web applications. The vast majority of websites use it, and all major web browsers have a

dedicated JavaScript engine to execute it.

Css

Cascading Style Sheets (CSS) is a style sheet language used for describing the presentation of a document written in a markup language like HTML. CSS is a cornerstone technology of the World Wide Web, alongside HTML and JavaScript.

CSS is designed to enable the separation of presentation and content, including layout, colors, and fonts. This separation can improve content accessibility, provide more flexibility and control in the specification of presentation characteristics, enable multiple web pages to share formatting by specifying the relevant CSS in a separate css file, and reduce complexity and repetition in the structural content.

Data Design

Data Model: A database model is a type of data model that determines the logical structure of a database and fundamentally determines in which manner data can be stored, organised and manipulated.

CART

ORDERS

A screenshot of a web browser window showing an order placement form. The title 'Marigold Shopping Cart' is at the top. Below it is a navigation bar with links: Home, Contact, Products, Cart, Account +, a search icon, a user icon, a heart icon (0), and a shopping cart icon (2). The main content area has a header 'Place Your Order'. It contains several input fields for personal information: 'your name : enter your name', 'your number : enter your number', 'your email : enter your email', 'payment method : cash on delivery', 'address line 01 : e.g. flat no.', 'address line 02 : e.g. street name', 'city : e.g. mumbai', 'state : e.g. maharashtra', 'country : e.g. india', 'pin code : e.g. 123456', and a large green 'Order Now' button at the bottom.

3. Views with username and password

View	Username	Password	Description
Admin	xyz@gmail.com	xyz	They are the salesperson or employees of the company
Customer	abc@abc.com	abc	They are the online shopper of the company

4. Business Plan

Our ecommerce website aims to provide customers with a seamless and convenient online shopping experience. Our platform will offer a wide range of products from various categories, including electronics, fashion, home and garden, sports and outdoors, health and beauty, and many more. We will focus on providing high-quality products, competitive pricing, and exceptional customer service. Our goal is to become a leading ecommerce destination for consumers looking to shop online.

The plan is to sell the products that are related to the Marigold.

These products include all the covers, electronics items, clothing items, skincare, etc items. I thought the website should be very minimal and it can be understandable by each and everyone. I kept the categories very simple. Customers can be found useful if he/she understands the website navigation is simple. Also make the database simple and can manipulate the database easily.

Our ecommerce website will offer a wide range of products from various categories, including electronics, fashion, home and garden, sports and outdoors, health and beauty, and many more. We will source high-quality products from reputable suppliers and ensure that all products meet our

quality standards.

Our platform will also provide exceptional customer service to ensure that our customers have a hassle-free shopping experience. We will offer various payment options, including credit card, debit card, and cash on delivery, to make it easy for customers to purchase products.

5. Work Plan, Responsibilities and Workflow

Work Responsibilities: Throughout the project work. As the project is individual. I had to take care of all the steps while we made the project. Following are the steps that I have completed and planned accordingly.

1. Worked on the ER diagram
2. Implementation of login landing page for the Admin page
3. Design of database architecture of admin, brands, and cart
4. Code for the Admin page
5. Layout and design the Admin page
6. Adding 10 products in the Admin Interface
7. Documentation of the project
8. Testing the modules
9. Design of database architecture of order and user info
10. Implementation of Register landing pad
11. Code for the Customer page
12. Add to cart page of the customer view
13. Layout and design the Customer page
14. Adding 30 products in the Admin Interface

6. Conclusion and Future Work

In this project, we have learned to manage the different user roles and content of the website. We have also learned the basics of an e-commerce website. The main purpose of building this website is to help customers purchase products from any vendor because all the vendors are selling their products on a single platform. With the advancement of technology, consumers have been able to enjoy a better online shopping experience over the years and this will continue for years to come. Several

experts predict that online shopping will overtake in-store shopping soon due to the rapid growth of products and brands. An online shopping system that depicts gift shopping and online purchase is the purpose of this project.
